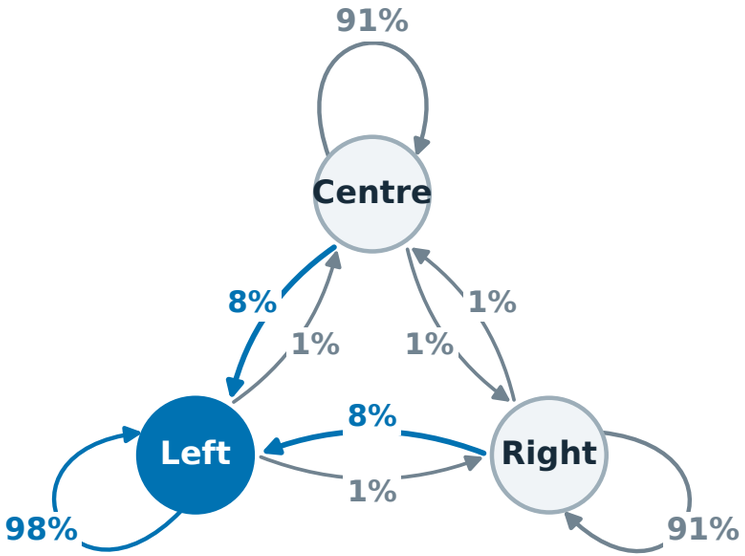
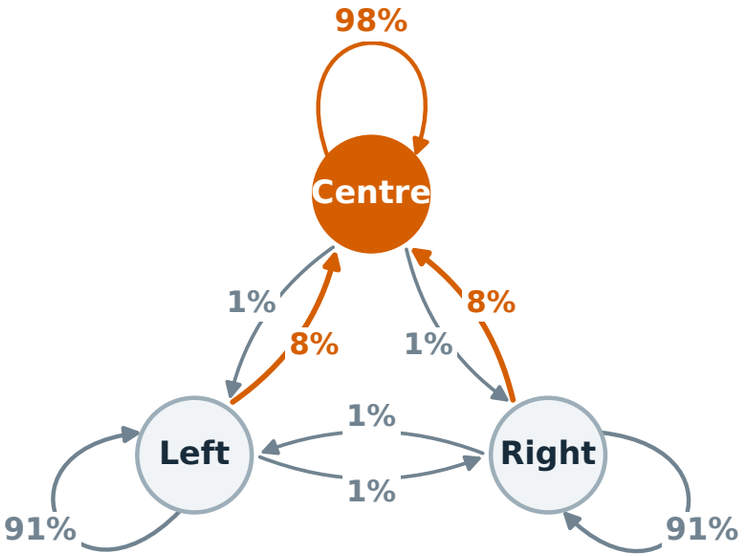
A three-location placement MDP

State = object location. All three placement actions are available in every state.

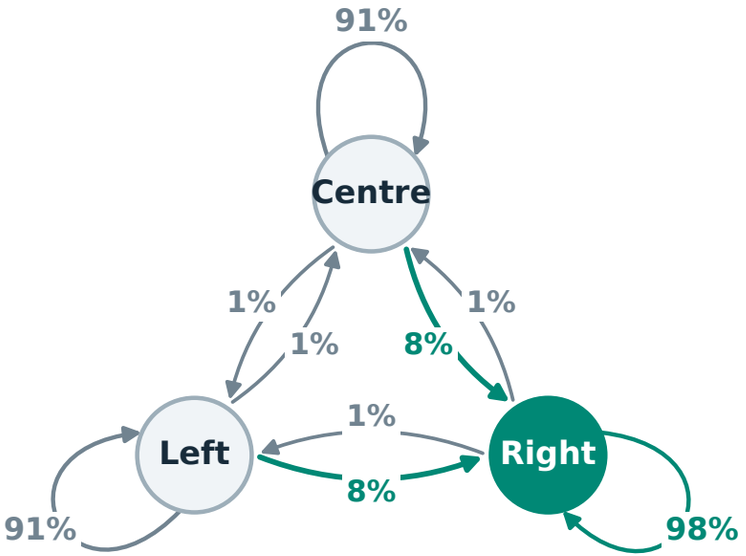
Action: place left



Action: place centre



Action: place right



Each panel is the same three states under a different action. Arrow labels are total one-step probabilities.

The transition rule

90%: keep the current location. 10%: attempt placement — 80% intended location, 10% each other location.

A command to the current location stays there with probability 98%; a command elsewhere stays put with probability 91%.
